Renewable Energy World <http://www.renewableenergyworld.com/rea/home>

Today's Alternative Energy—Promising technologies to wean the world from fossil fuels, including offshore wind, solar, geothermal and hydrogen cars, among others Scientific American Online
<http://www.sciam.com/report.cfm?id=alternative-energy>

The Power of Renewables; March 2009; Scientific American Magazine; by Matthew L. Wald; 6 Page(s)
Renewable energy, such as from photovoltaic electricity and ethanol, today supplies less than 7 percent of U.S. consumption. If we leave aside hydroelectric power, it is under 4.5 percent. Globally, renewables provide only about 3.5 percent of electricity and even less of transportation fuels. But increasing that fraction for the U.S.—as seems necessary for managing greenhouse gases, trade deficits and dependence on foreign suppliers—has at least three tricky components. The obvious one is how to capture the energy of wind, sun and crops economically. After that, the energy has to be moved from where it is easily gathered, such as the sunny American Southwest or the windy High Plains, to the places it can be used. And the third is to convert it into convenient forms. Most prominently in the last category, electricity for transportation has to be loaded into cars and trucks, either through batteries or perhaps as hydrogen.

The Renewable Energy Policy Network for the 21st Century (REN21) is a global policy network that provides a forum for international leadership on renewable energy. Its goal is to bolster policy development for the rapid expansion of renewable energies in developing and industrialised economies.
<http://www.ren21.net/default.asp>

Renewables 2010 Global Status Report – REN21 <http://www.ren21.net/globalstatusreport/g2010.asp>

International Renewable Energy Agency (IRENA) IRENA aims at becoming the main driving force in promoting a rapid transition towards the widespread and sustainable use of renewable energy on a global scale. Acting as the global voice for renewable energies, IRENA will provide practical advice and support for both industrialized and developing countries, help them improve their regulatory frameworks and build capacity. The agency will facilitate access to all relevant information including reliable data on the potential of renewable energy, best practices, effective financial mechanisms and state-of-the-art technological expertise. <http://www.irena.org/home/index.aspx?mnu=hom>

U.S. Department of Energy- Energy Efficiency and Renewable Energy Network (EREN) – Energy Information Portal -- Includes information about energy and technology. Also, contains the newsletter, subscriptions, and links to other resources; consumers, environment, kids, education, small business, etc.

10 Everyday Technologies That Can Change the World Who knew that providing energy and water for all could be a matter of foot cranks and dirt power? by Karen Rowan; extra reporting by Andrew Grant published online September 8, 2008, Discover <http://discovermagazine.com/2008/oct/08-10-everyday-technologies-that-can-change-the-world/>

Made available under the auspices of the Ball State University Academy for Sustainability Knowledge Group

Greenlight Planet is combining cutting-edge technology with innovative distribution networks to commercialize low-power LED lanterns. The new lights are bright, long-lasting, and practical. But more importantly, they are affordable enough that villagers can purchase them immediately in cash, meaning the technology can profitably scale to help hundreds of millions. <http://www.greenlightplanet.com/>

Solar

SkyFuel -- As a solar thermal energy supplier, SkyFuel designs, delivers and operates the solar field up to the heat exchanger that generates steam for the power block. Our two thermal Concentrating Solar Power (CSP) technologies, SkyTrough™ (parabolic trough) and Linear Power Tower™ (linear Fresnel) employ arrays of reflectors that focus 50-100 times the Sun's normal radiation onto heat-absorbing pipes. This creates clean, renewable solar-generated steam that can be used for electric power generation or industrial processes. **[Be sure to watch video]** <http://www.skyfuel.com/>

Solar Cookers Archives: Sponsored by Solar Cookers International the Solar Cookers Archives offer simple instructions to build your own solar oven, some fun recipes to try out and adventurous experiment for all ages. (English site but online translation available through AltaVista/babelfish service)

Verdant Power's **Free Flow Kinetic Hydropower System** is a renewable energy technology that uses axial-flow turbines deployed underwater to convert the kinetic energy of [tides](#) and [rivers](#) into electricity. The Free Flow System is installed fully underwater and operates automatically and invisible from shore. The system does not require dams, impoundments or major civil works, and does not redirect the natural flow of the water. Simple and modular in design, Free Flow Systems can be scaled in unit size and number to generate clean energy in a wide range of sites worldwide. [online animations]
